

SHOWER PRODUCTS

The shower is probably the most important product in your bathroom, something you use every day to relax or revive. We recommend that you always choose quality branded products to facilitate aftersales purchases.

Things to consider when selecting a shower:

- Style – modern, traditional
- Control – manual, thermostatic
- Valve – concealed, exposed
- Shower Head - fixed head, hand shower
- Finish - chrome, brass, black
- Spray pattern

Shower Valves

Manually Controlled Valves

With manually controlled valves, you control the mix of water. A big downfall is that you can accidentally hit against the shower control when showering, causing the water to become extremely hot. This is highly dangerous as it could scald a child or older person who may not be agile enough to correct it quickly.

Thermostatic Valves

Thermostatic valves are the most popular valve type. They have two controls, one for flow and a second for temperature control. You select the temperature and this remains constant. These controls are available in either a dial or button format and can be square or round in design.

Thermostatic Touch Control Valve

You just press the select button to activate the shower.

Concealed Valves

Behind all valves plates is either a smartbox or brass shower valve. We recommend brass for longevity. All parts are accessible through the plate. The smart box will reduce wall noise when in use.

Shower Heads

Ceiling Shower Heads

Ceiling shower heads can be either concealed in the ceiling or have an arm as shown here. Multiple spray pattern options include rain, mist, cascade or a single pour. Further options include built in lights and colour changing features.

Wall Mounted Shower Heads

Wall mounted shower heads can be square, oval or round in shape. They can be slim in design or have a regular watering can shape. Many come with rubber nipples to facilitate cleaning of limestone deposits. Sizes range from 150mm, 200mm to 300mm and they can have either a 400mm arm or an angled 1800mm arm. (This off course is just an idea of what is possible.) They are generally fitted at 180mm above the height of the tallest person in the house. A note of caution - Do not position over the waste outlet as this will affect the flow rate of drain.

Hand showers

Hand showers are the most practical of all showers. You can have a shower without wetting your hair, target specific areas, easily facilitate for all heights in a family - And use it to wash out the shower cubicle! Hand showers come in both round and square with differing rail lengths and an array of finishes.

Please email Tony Murphy our Bathroom Sales Manager with any queries you may have and he will get back to you as soon as possible. tony@tilestyle.ie
